

Case Study

Soper's Softwall Enclosure Solves Noise Problem at Boeing

Boeing's Winnipeg facility was having a problem with noise as a result of its steel cutting 5-Axis machinery. Boeing hired Soper's to provide a Softwall noise enclosure system that met all of Boeing's specified criteria. (Soper's was recommended due to successfully solving a previous noise problem at one of Boeing's plants in Ontario).

In total, Soper's designed, manufactured, and installed four enclosures: two customized to fit the existing machine posts and two free-hanging from the ceiling joists. The Softwall enclosure system is manufactured of Class A fire-rated Fibreglass material and includes clear PVC panels for visibility. Further, a Soper's strip curtain system allows employees hands-free entry into the enclosed area.

Ultimately, Soper's was able to reduce noise levels by 15 dB.
